

INDIVIDUAL REFLECTION

Retail Category Intelligence · MUC01

G. AKASH

ETL

My Contribution

In this project, I mainly worked on the **ETL and data validation** part. My responsibility was to prepare the raw retail data for analysis by checking its structure, data types, missing values, and duplicate transactions. I cleaned and standardized the required fields, converted dates into a proper format, and created analytical fields such as **month, weekday, and discount brackets**. I also validated business rules and checked revenue calculations to ensure the data was reliable. Finally, I prepared the cleaned dataset for EDA so that the team could confidently use it for further analysis and insights.

What I Learned from My Teammates

I learned something useful from each of my teammates. From **Pavithra**, I understood how analysis can be converted into clear business insights and recommendations. From **Ashika**, I learned how product-level analysis provides deeper details than category-level analysis. From **Manish**, I learned how monthly and weekday patterns can add more meaning to revenue analysis. Working together also helped me understand how different parts of an analysis can be combined into one clear business story.

Key Takeaway

This project helped me understand the importance of clean, validated data as the foundation for reliable analysis and business decisions.
